# Longitudinal Change of Transparency

(with TRWKR, no rain)

## ■ Has transparency been revived?

The transparency of early summer (1<sup>st</sup> and 3<sup>rd</sup> stage) was 50cm-70cm in almost of all points downstream of the Sanage bridge. And the transparency of early winter (2<sup>nd</sup> and 4<sup>th</sup> stage) was over 80cm except Asahi Bridge - Johoku Bridge.

In a longitudinal view, transparency got worse between the Asahi Bridge and the Johoku Bridge and it becomes better between the Minatoshinbashi Bridge and the Oseko Bridge.
